Agenda

- ▀ Inverter-level troubleshooting
- ▀ Power optimizer-level troubleshooting
- ▀ Examples

Inverter Level

Is the Inverter:
Communicating?

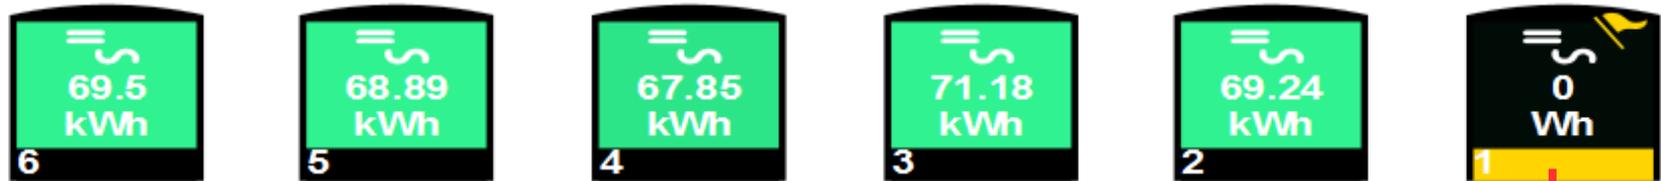

Producing?

Underperforming?

1. Is the Inverter Communicating?

How to identify?

Energy display: **Daily** Weekly Monthly Yearly Total Hierarchy

Name	Manufacturer	Model	Serial Number	Last Measured
Inverter 1	SolarEdge	SE17k	7E1815E0-8B	09/19/2014 4:07 PM
Inverter 2	SolarEdge	SE17k	7E1815D4-7F	10/16/2014 6:34 PM

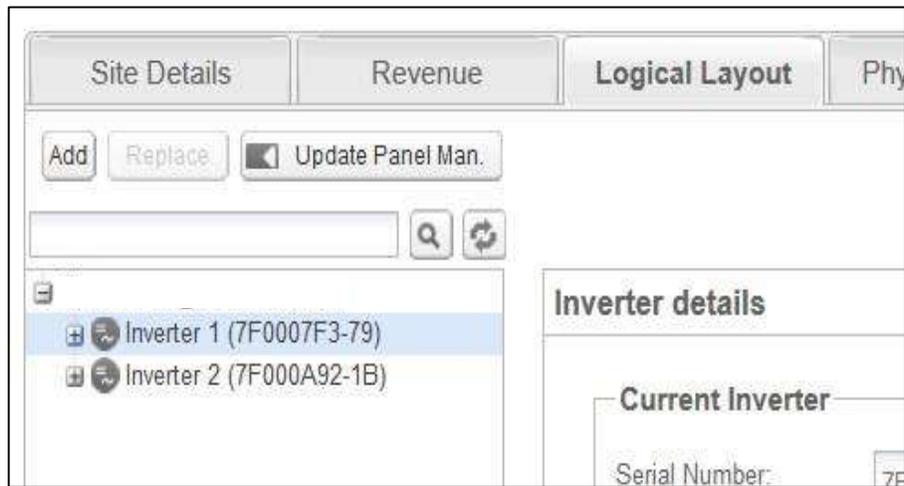

Not communicating OR not producing

No data from inverter No data received from Inverter 1 in the last Day - check communication

If the No data from inverter alert rule is enabled

1a. Is the Inverter Communicating?

- Has the inverter been replaced without updating the serial number in the monitoring platform?
 - Go to **Admin – Logical Layout** to enter the correct serial number
- Contact the system owner to check the inverter connection and communication status

2. Is the Inverter Producing?

How to identify?

Energy display: **Daily** Weekly Monthly Yearly Total Hierarchy

Not communicating OR not producing

Name	Manufacturer	Model	Serial Number	Last Measured	I AC [A]	P AC [W]	V AC [V]	V DC [V]	Energy [Wh]
Inverter 1	SolarEdge	SE17k	7E1815E0-8B	10/16/2014 6:34 PM	0 ✓	0	228.61	885.06	0 ✗
Inverter 2	SolarEdge	SE17k	7E1815D4-7F	10/16/2014 6:34 PM	0 ✓	0	227.14	63.13	69,242.05 ✓

Communicating

Not producing

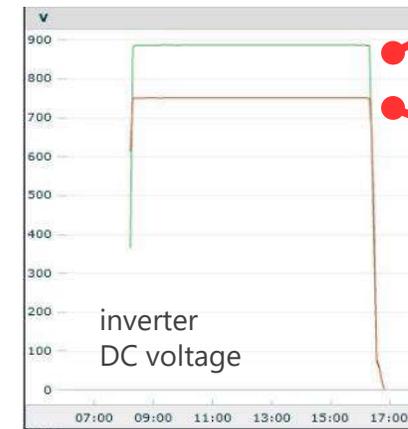

2a. Inverter is Not Producing - Troubleshooting

Check the inverter DC voltage in the table below the layout

Name ▲	Manufacturer	Model	Serial Number	Last Measured	I AC [A]	P AC [W]	V AC [V]	V DC [V]	Energy [Wh]
Inverter 1	SolarEdge	SE17k	7E1815E0-8B	09/19/2014 4:07 PM	0	0	228.61	885.06	0

- If Vdc = safety voltage, check:
 - ON/OFF switch is in the ON position
 - System is paired? -> re-pair
- If Vdc is higher than Vdc nominal for long periods of time, check:
 - Inverter errors in the **Layout**
 - If the inverter displays an error

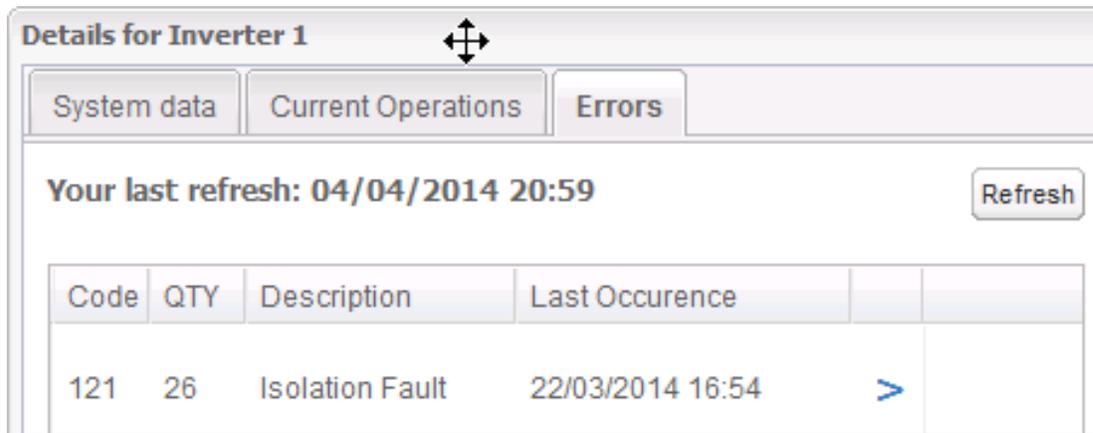

≈ 880V ✗
= stuck at startup voltage due to error

≈ 750V ✓
= nominal voltage three phase inverter

2a. Inverter is Not Producing – Troubleshooting (cont.)

- Confirm design follows SolarEdge design rules (min # power optimizers, etc.)
- Check inverter for errors
 - Right-click on inverter in the layout
 - Select **Info** and check **System data** and **Errors** for possible error messages
 - AC voltage & AC frequency errors can be due to a wrong country setting of the inverter

The screenshot shows the 'Details for Inverter 1' window with three tabs: 'System data', 'Current Operations', and 'Errors'. The 'Errors' tab is active, displaying a table with one error entry. The table has columns for Code, QTY, Description, and Last Occurrence. The error entry is: Code 121, QTY 26, Description 'Isolation Fault', and Last Occurrence '22/03/2014 16:54'. A 'Refresh' button is located to the right of the table. Above the table, it says 'Your last refresh: 04/04/2014 20:59'.

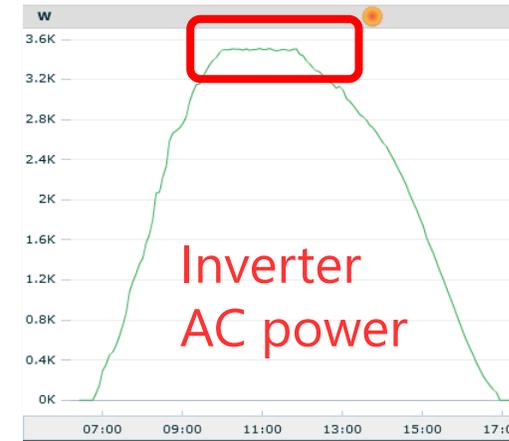

Code	QTY	Description	Last Occurrence
121	26	Isolation Fault	22/03/2014 16:54

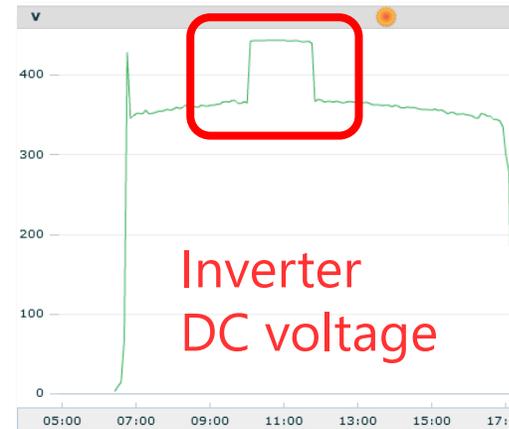

3. Is the Inverter Underperforming?

AC clipping can be due to:

- Undersized inverter (unless intended, install larger inverter)
- Smart energy management limiting output (correct system behaviour)
- Overheating (clean fan/heatsink, check clearances)
- Technical/configuration issue (contact SolarEdge)

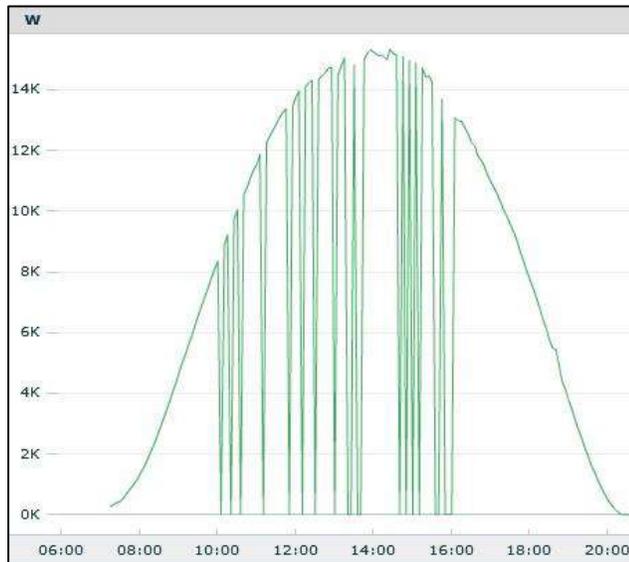

→ Check for power clipping in the inverter AC power curve

→ Check inverter DC voltage for verification (DC well above nominal voltage)

3a. Is the Inverter Underperforming? Troubleshooting

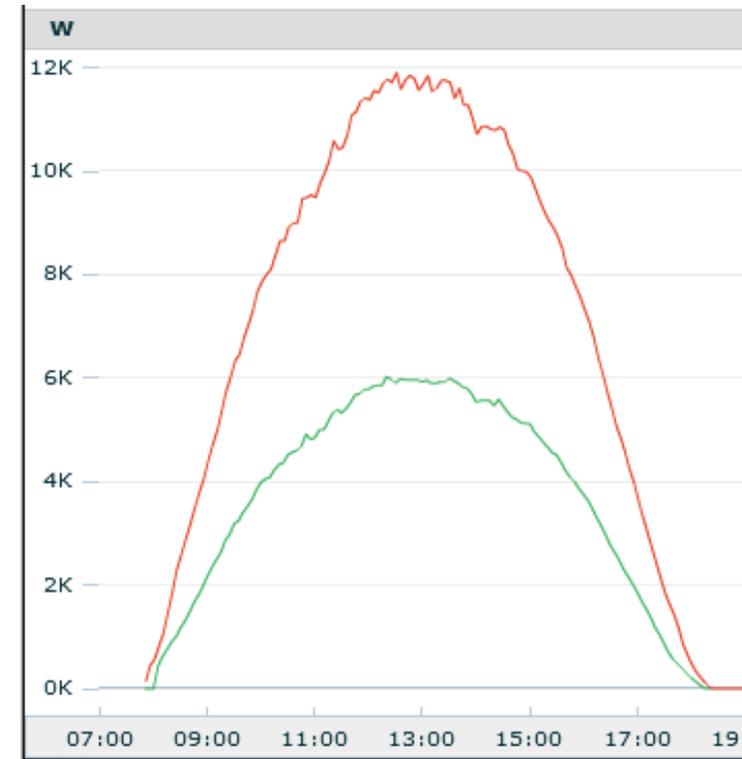

- Select a sunny day, when checking a system – this makes finding issues much easier
 - In the layout, right-click on the inverter and select **Info**
 - Check the **Errors** tab and check inverters display for error code

→ Power curve looks scattered despite perfectly sunny conditions

The inverter might be shutting down due to an error

Code	QTY	Description	Last Occurrence
99	1	AC Voltage Too High ...	09/19/2014 15:44

→ Inverter produces a lot less than other inverters on site.

Possible problem with one of the inverter's strings

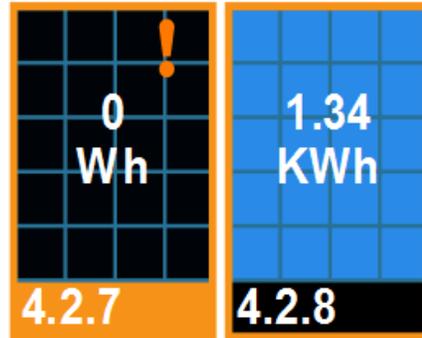

Power Optimizer Level

Is the Power Optimizer:
Communicating?
Producing?
Underperforming?

1. Is the Power Optimizer Communicating?

How to identify?

Not communicating OR not producing

Name ▲	Manufacturer	Model	Serial Number	Last Measured
Panel 4.2.7			0004FA9A-98	17/10/2013 5:16 PM
Panel 4.2.8			0004FACA-C8	04/04/2014 6:38 PM

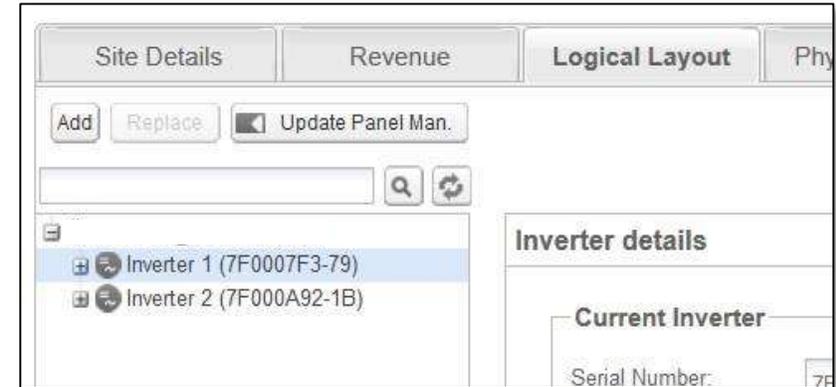

If the **Power shutdown** alert rule is enabled, the following alert will appear:

Power optimizer shutdown No measurements received from Panel 33.2.1 in the last 2 Days !

If it is disabled, a black power optimizer will be displayed, but without an alert

1a. Power Optimizer Communication Troubleshooting

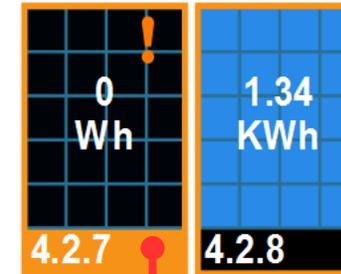

- Has a power optimizer been replaced without updating the serial number in the monitoring platform?
 - Check the logical layout to see all operating power optimizers
 - Go to **Admin – Logical Layout** to correct the serial number
- Contact the system owner to check:
 - Modules (for snow coverage, damage or extreme shading)
 - P-OK # on inverter display during daytime
 - If P-OK # is too low, send technician
 - If the P-OK # is correct, there is an issue in the monitoring platform. Call SolarEdge

2. Power Optimizer is Not Producing

How to identify?

- Locate the power optimizer that is not producing and review the last measurements

Not communicating OR
Not producing

Name	Serial Number	Last Measured	✓	Energy [Wh]	✓
Panel 4.2.7	0004FA9A-98	04/04/2014 6:38 PM	✓	0	✗
Panel 4.2.8	0004FACA-C8	04/04/2014 6:38 PM	✓	1,342.5	✓

Communicating Not producing

2a. Power Optimizer is Not Producing - Troubleshooting

- Only a single/few power optimizers not working?
 - Perform pairing to reassure that the power optimizer are listening on the correct frequency for the wake-up signal from the inverter
- Whole string not working?
 - Check if the string was designed according to the SolarEdge design rules
 - Re-design → Re-pair
- Check on-site all series connections of the string:
Cable, connectors, combiner boxes, DC-disconnects, etc.
- Contact SolarEdge for support

3. Are the Power Optimizers Underperforming?

- How to identify?
- Compare between modules

370.5 Wh	538.75 Wh	536.5 Wh
2.1.1	2.1.2	2.1.3

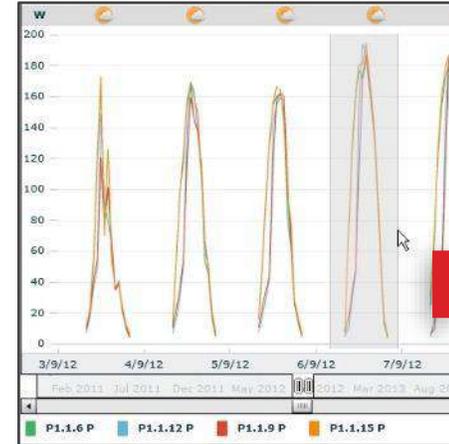

? ✓ ✓

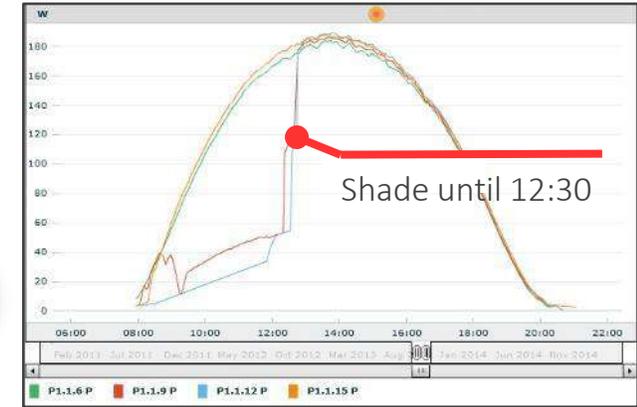

- Select one or more system components in the Layout menu
- Right-click on one of the selected components

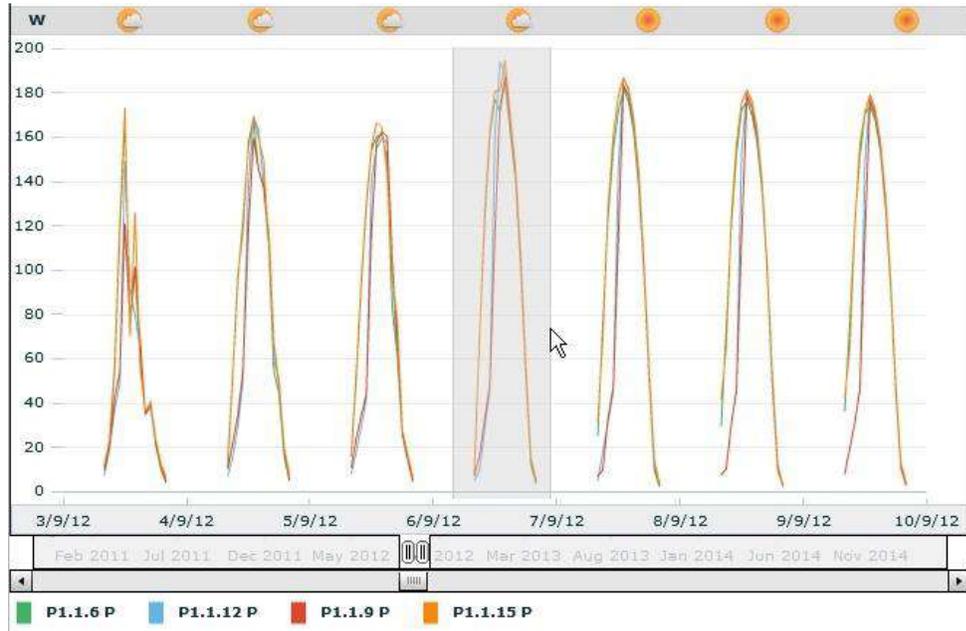

- Select a specific day in the graph

- Graph shows the output power of each module and allows comparison

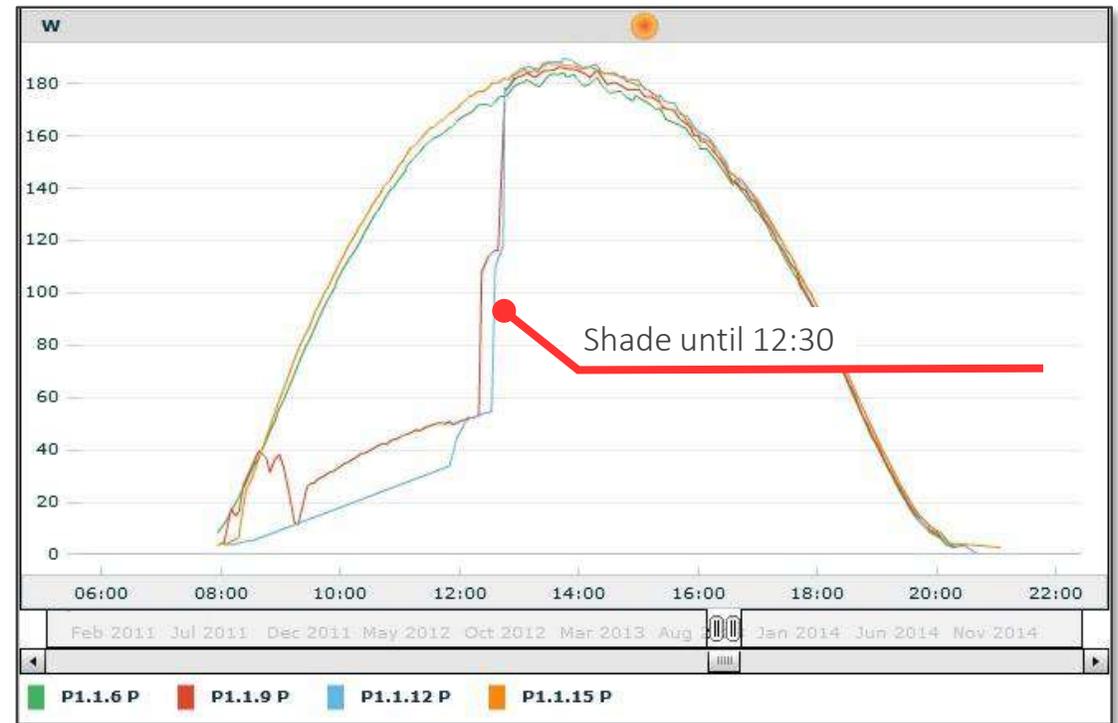

3a. Analyzing Underperforming Modules

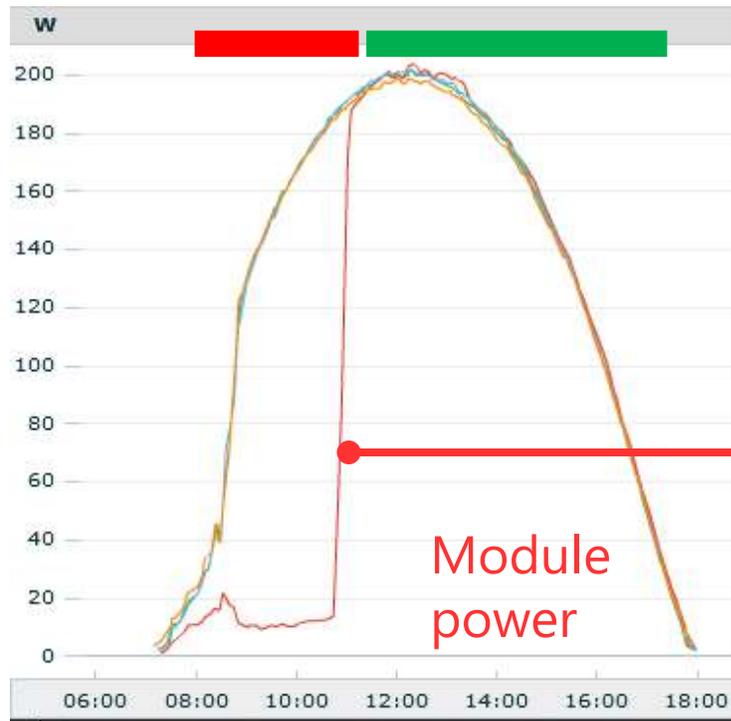

Graph shows the output power of each module and allows comparison

Select a specific day in the graph to zoom in

3b. Four Ways to Identify Shading

1. Check module's **Power** chart. Shading is often only occurring a certain times of the day

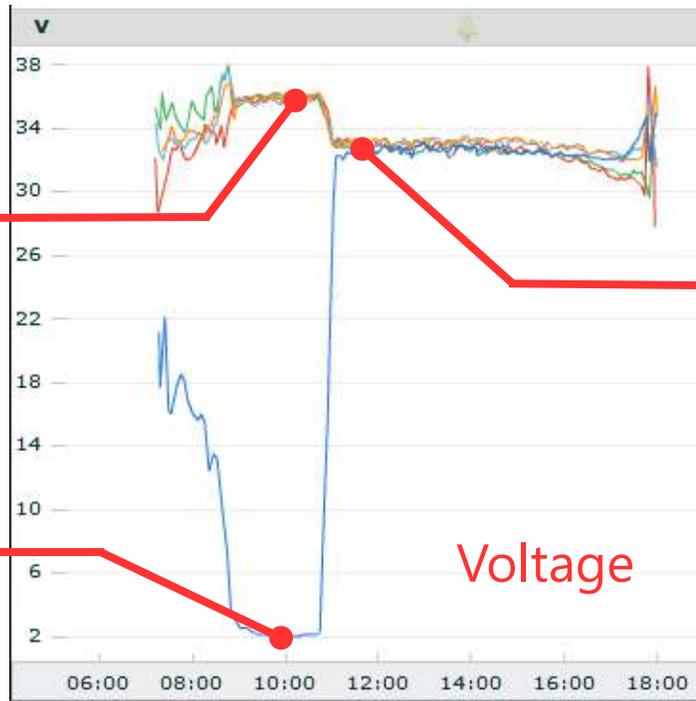

Reduced module power until 11:00

3b. Four Ways to Identify Shading (cont.)

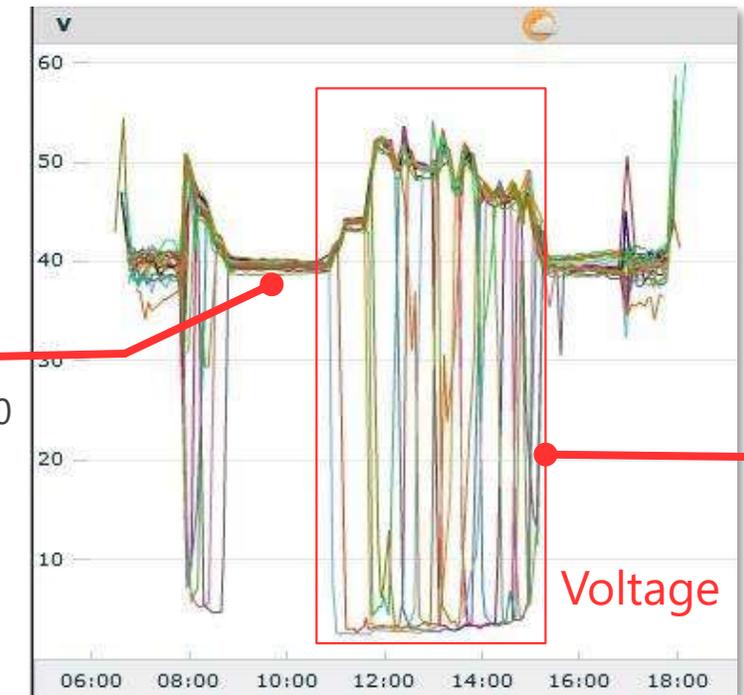

2. Check the Power Optimizer Voltage chart (showing power optimizer output voltage)

One shaded power optimizer:

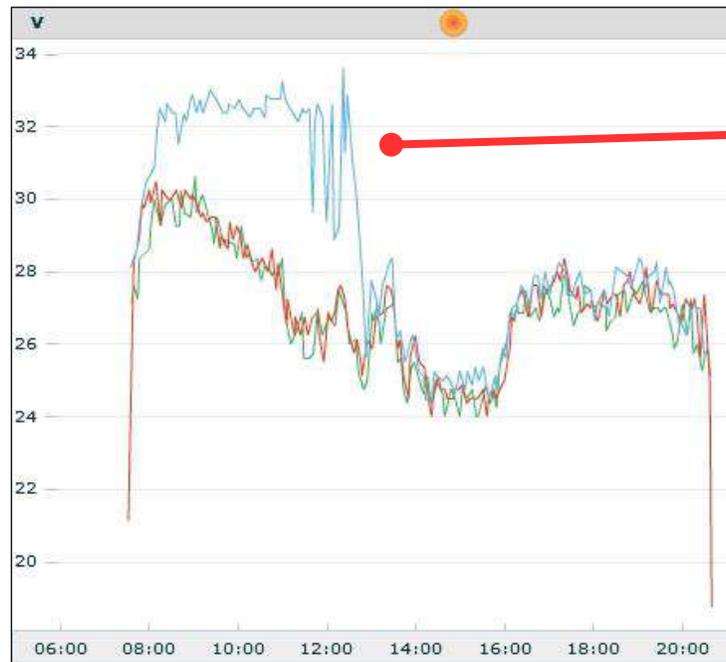

Shading gone after 11:00

Multiple shaded power optimizers:

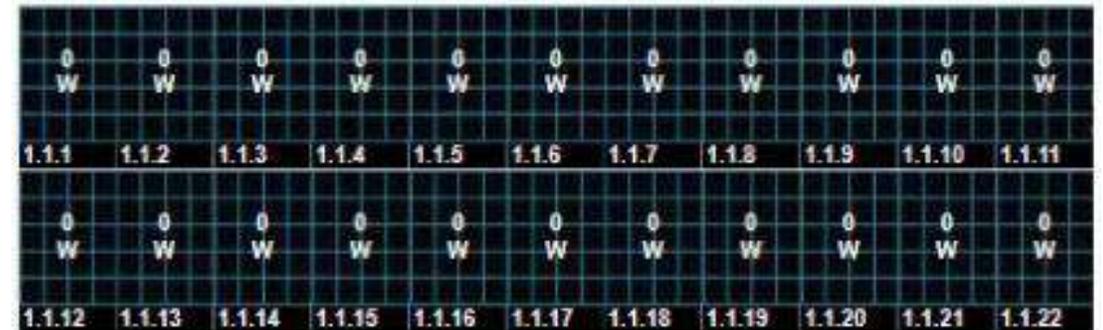

3b. Four Ways to Identify Shading (cont.)

3. Check module's **Voltage** chart (output voltage of module). Shading causes the power optimizer to pick a different MPP

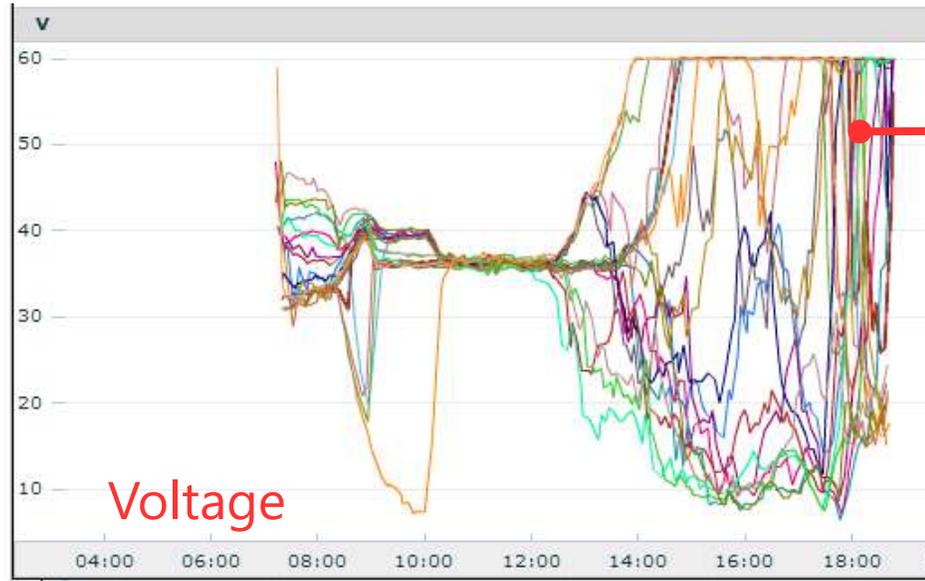

Shaded module with different MPP

4. Use the Layout's **Playback** feature

3c. Underperformance Troubleshooting

Power optimizers at max V_{out} for long periods of time

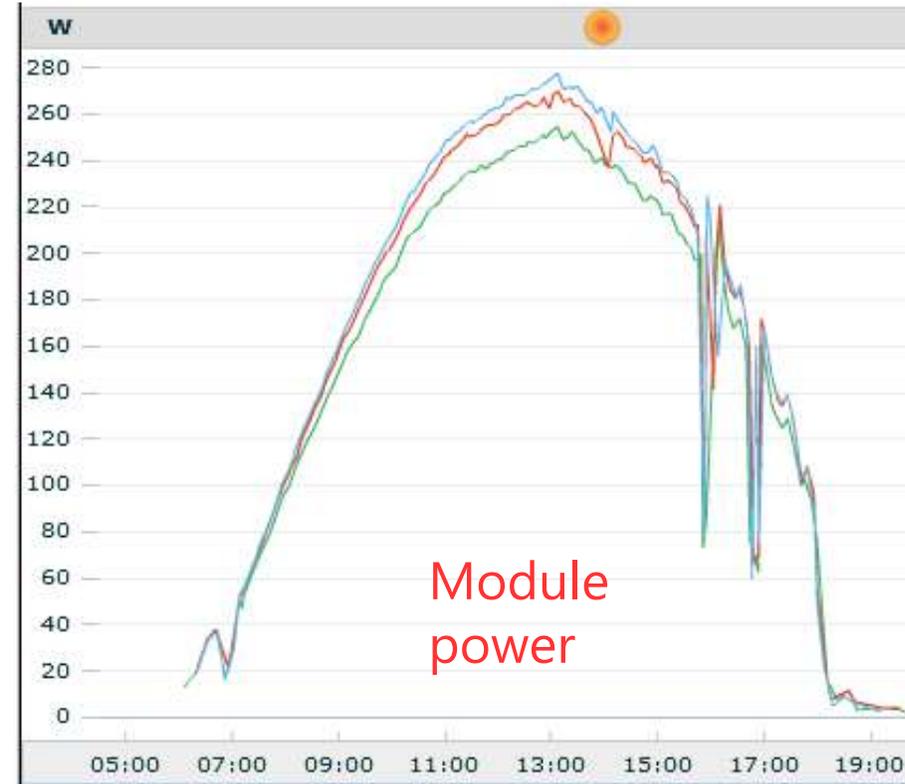

They operate at their voltage limit and cannot deliver the modules full power → They are **blocked**

Troubleshooting:

Check the design (minimum number of power optimizers per string).
Increase the number of power optimizers according to the design rules (e.g. by combining two strings in series)

3c. Underperformance Troubleshooting (cont.)

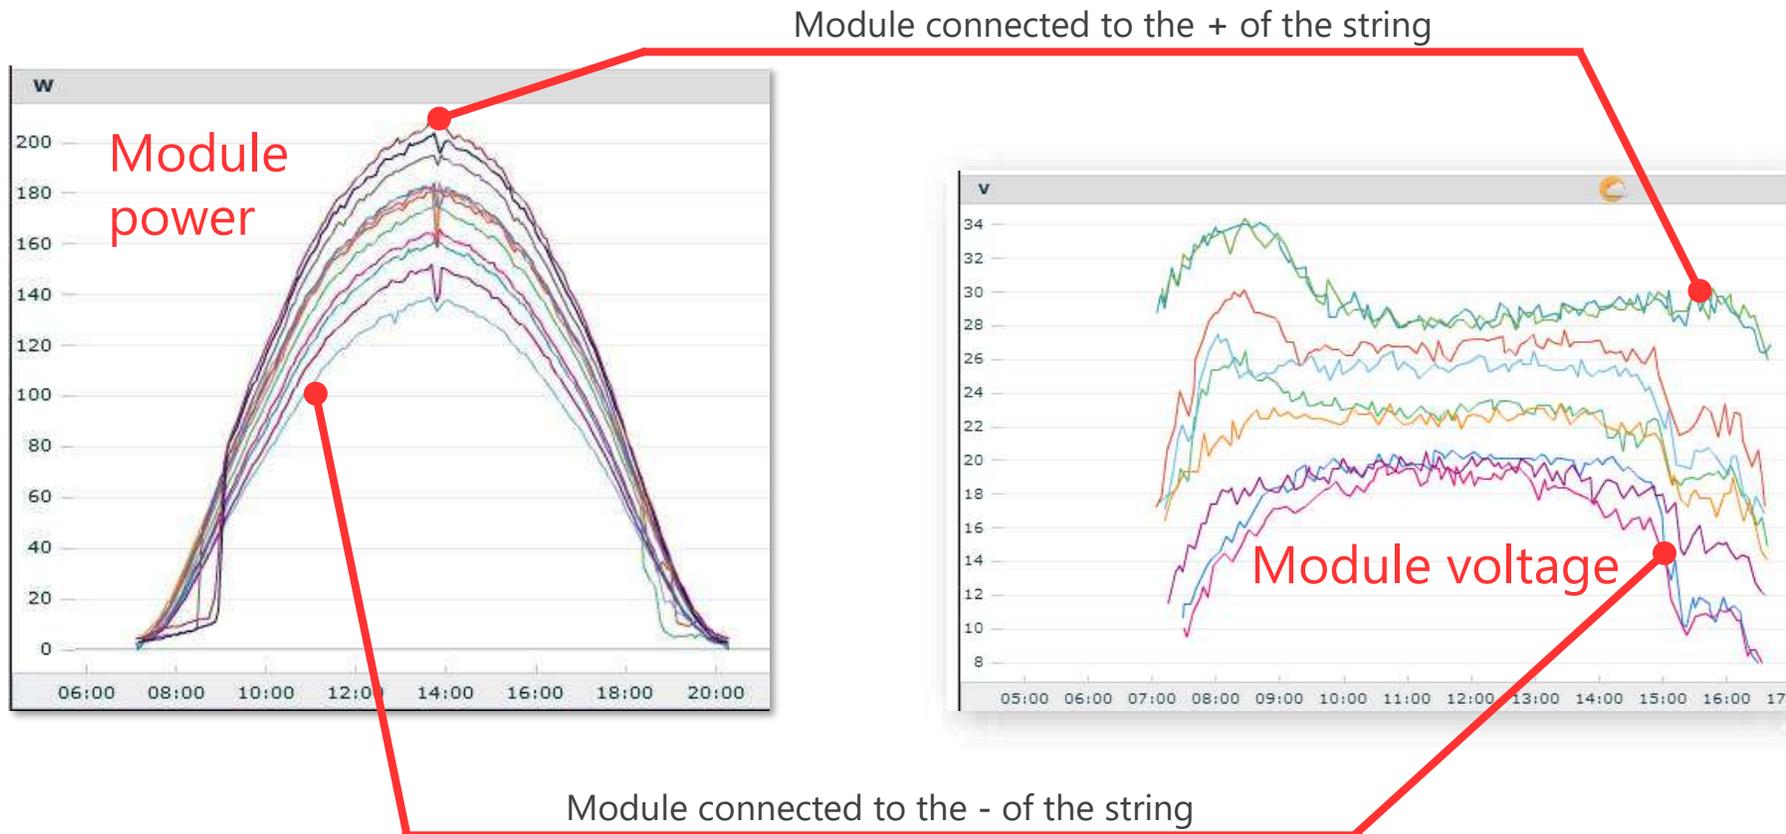

- Module mismatch
 - Optimizers measurement tolerances will cause a slight mismatch in the charts
 - Soiling can have a strong impact on the mismatch
 - If the mismatch grows over time (measured with clean modules), it might be necessary to check the modules' IV curves

3c. Underperformance Troubleshooting (cont.)

■ PID effect (potential induced degradation)

- The module power decreases from + to - of the string → Check modules

Let's Practice!

Inverter Examples

solaredge

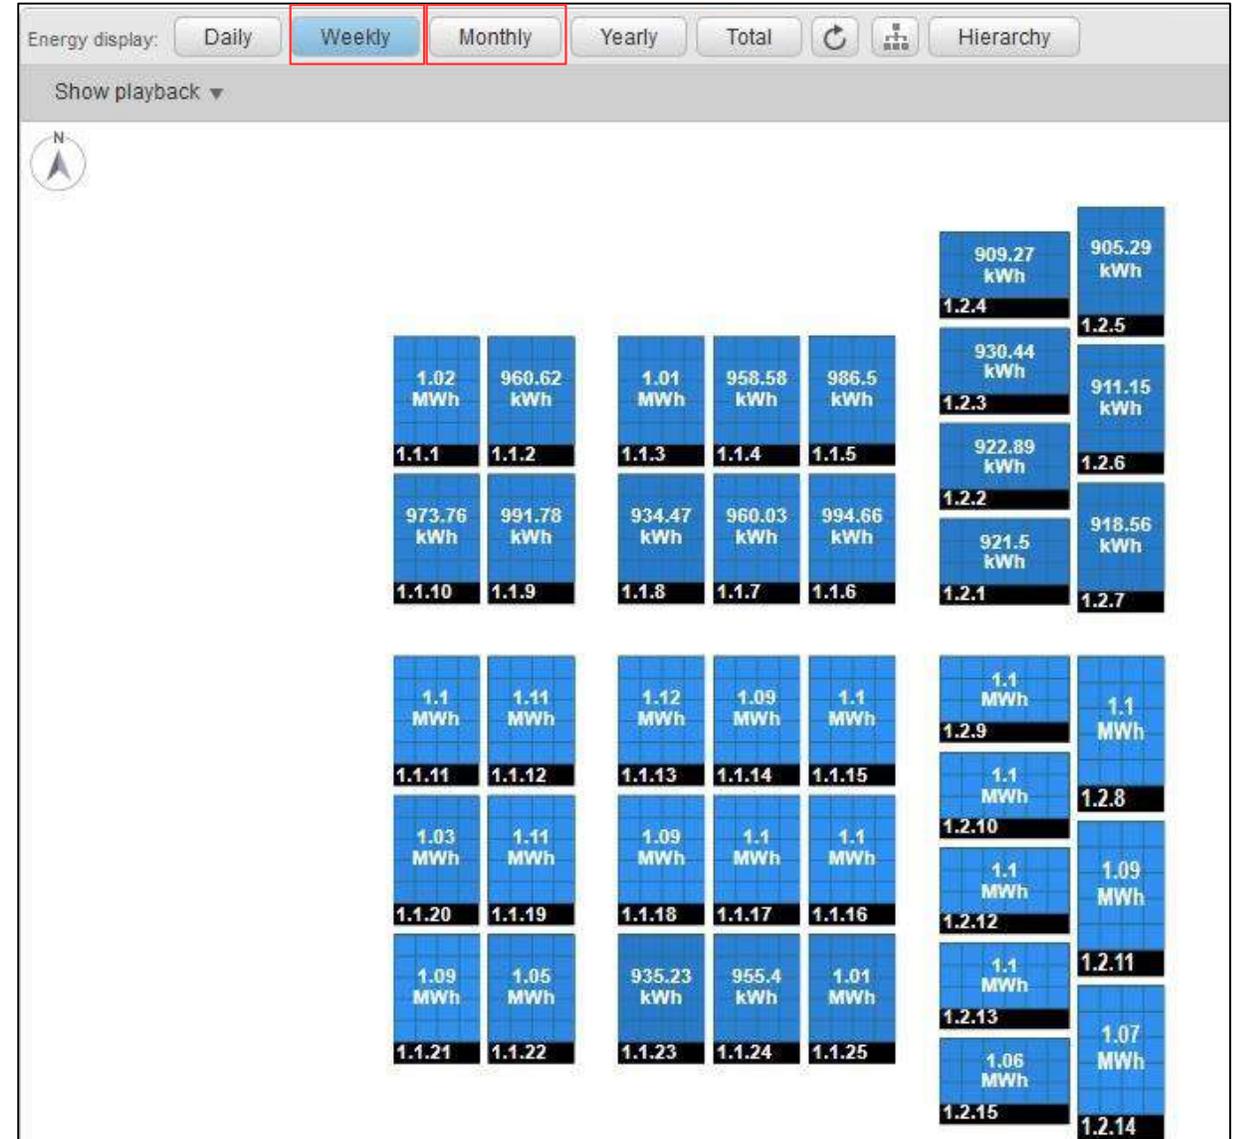

Inverter Example 1

Underperforming string?

Inverter Example 1

- Switching the timeframe shows that all modules produce roughly the same power

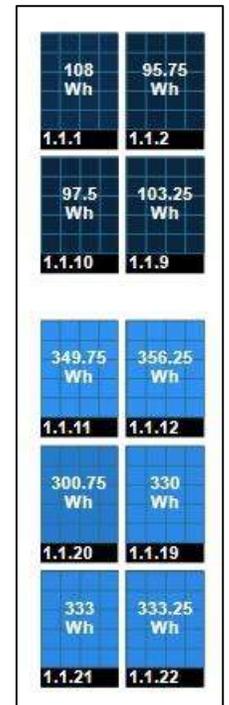

Inverter Example 1

- By looking at the module power charts, we can see that the arrays are set up in an east/west configuration

Layout view
at 10:30am

Inverter Example 2

- First indication of power derating

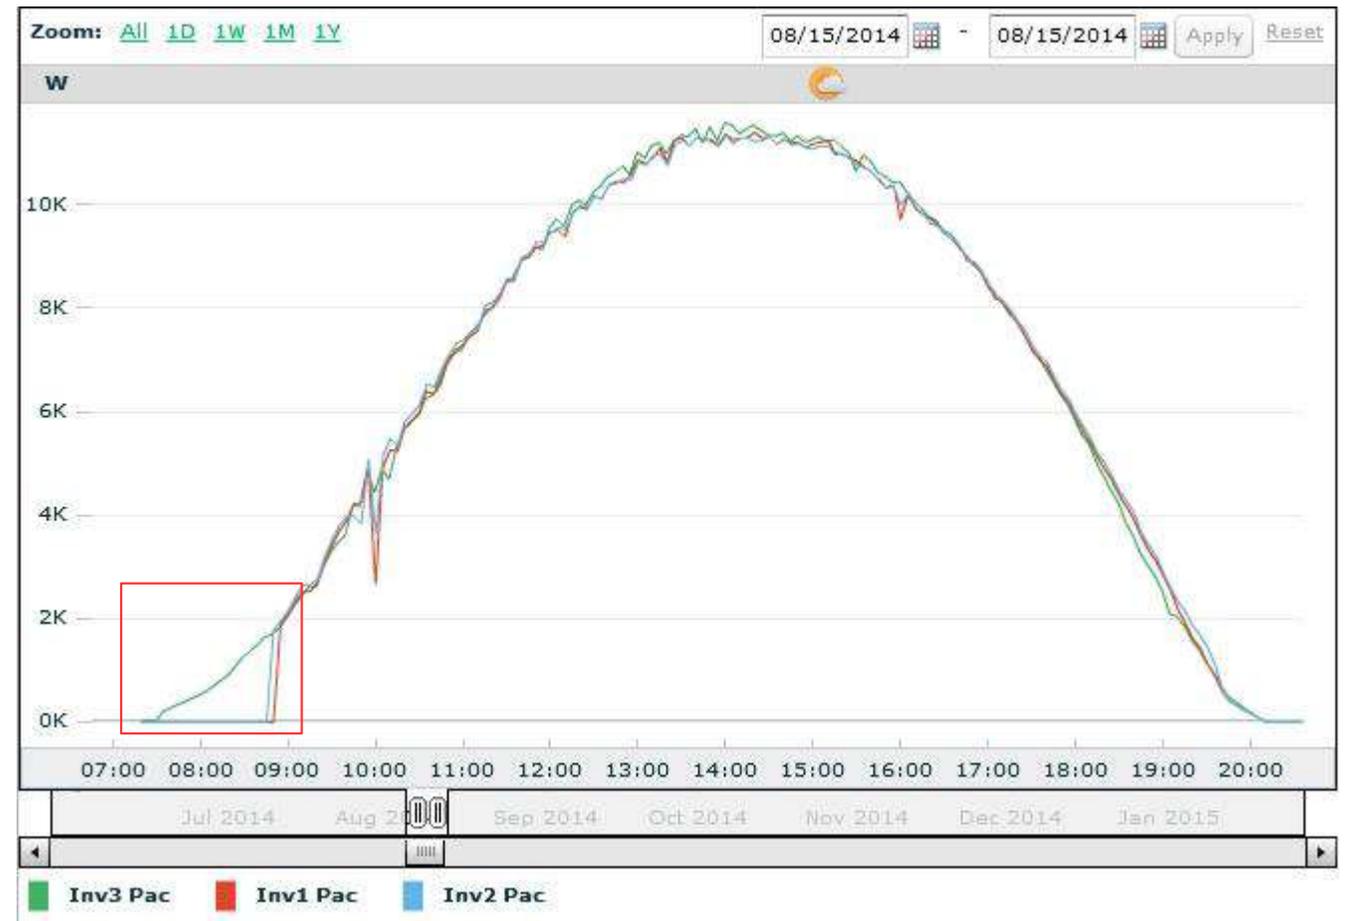

Inverter Example 2

- Confirmation of power derating (static)
 - Inverters AC limit, configured power/current limit

Inverter Example 3

- Two inverters start one hour later than the other inverter

Inverter Example 3

- If an inverter is not producing power, but the DC voltage remains higher than the nominal DC voltage, an inverter error is likely

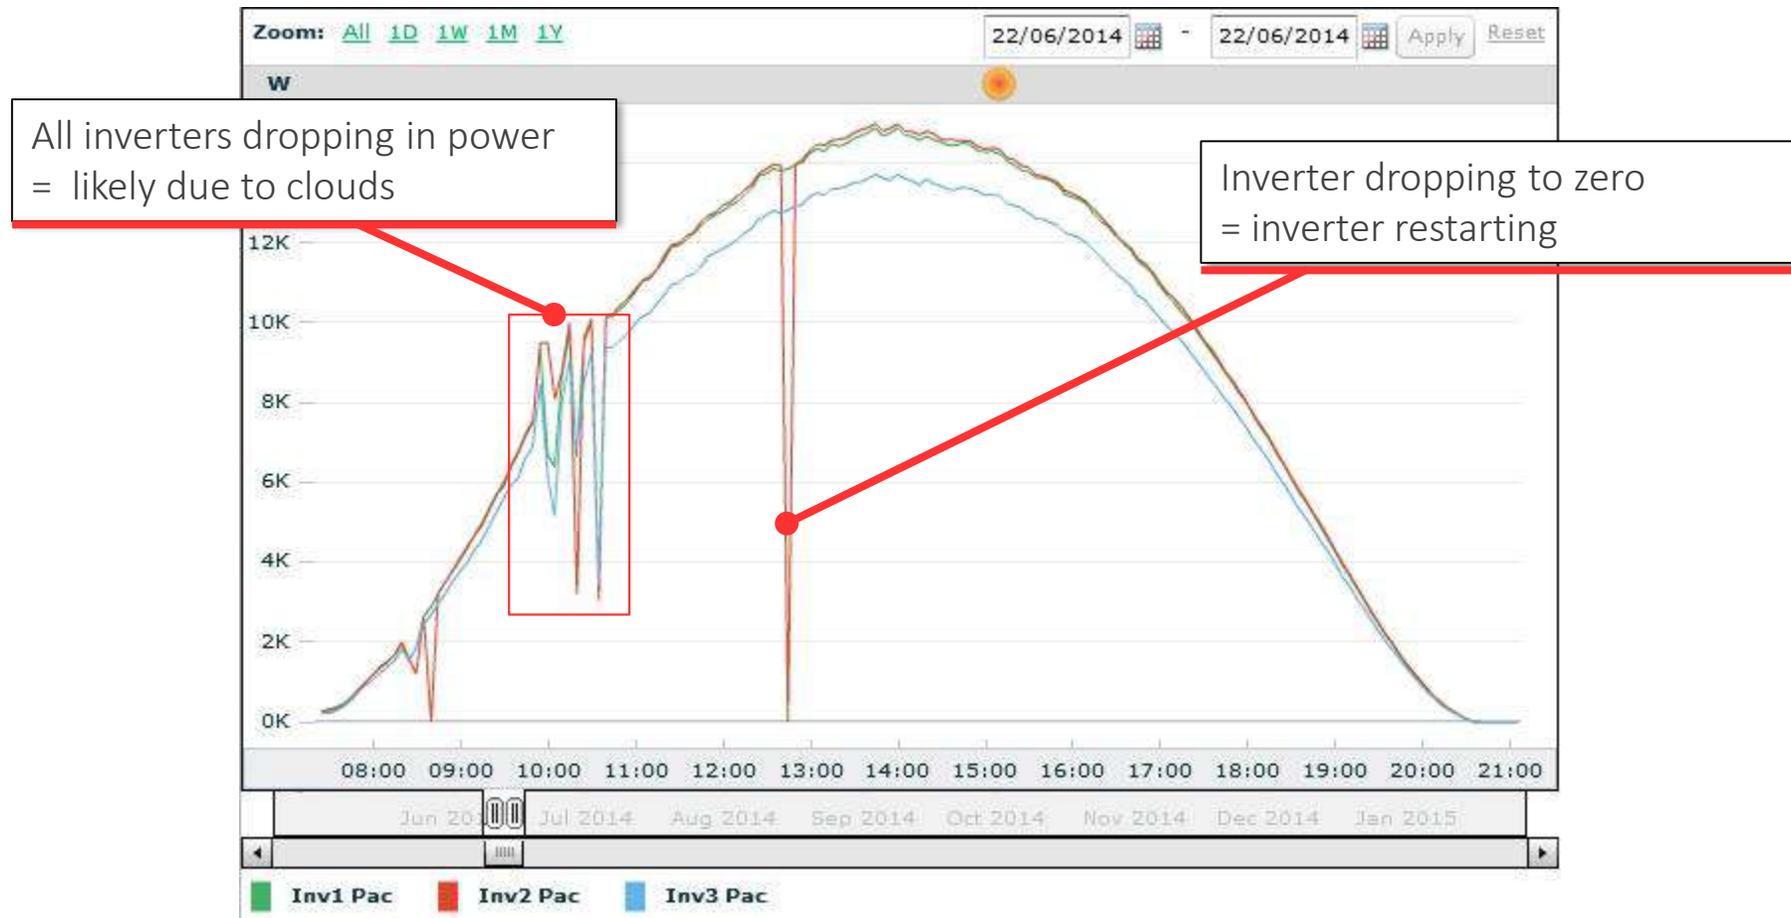

Isolation Fault

Inverter Example 4

■ In this example: inverter tripping due to wrong country setting

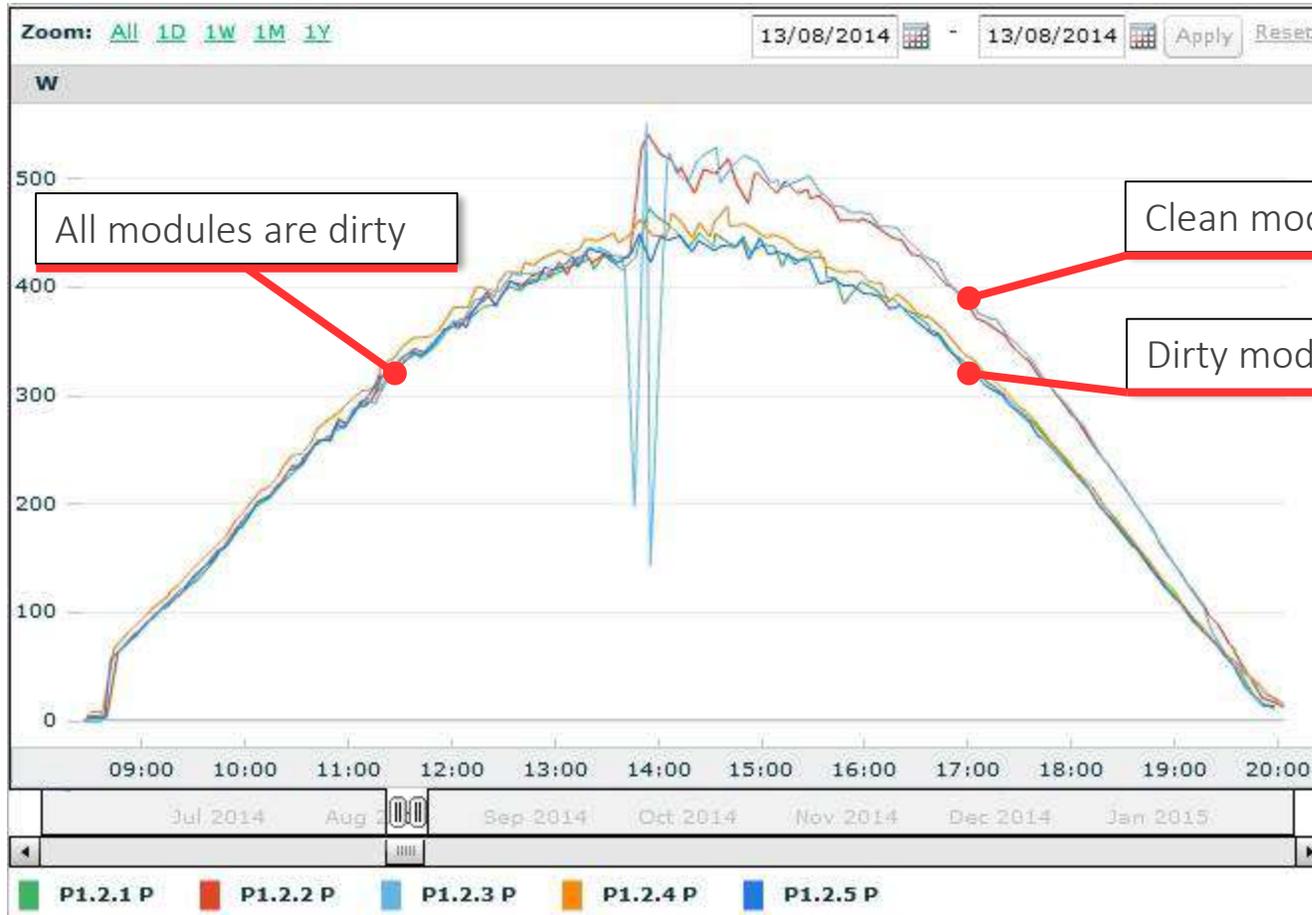

Frequency or Voltage Level

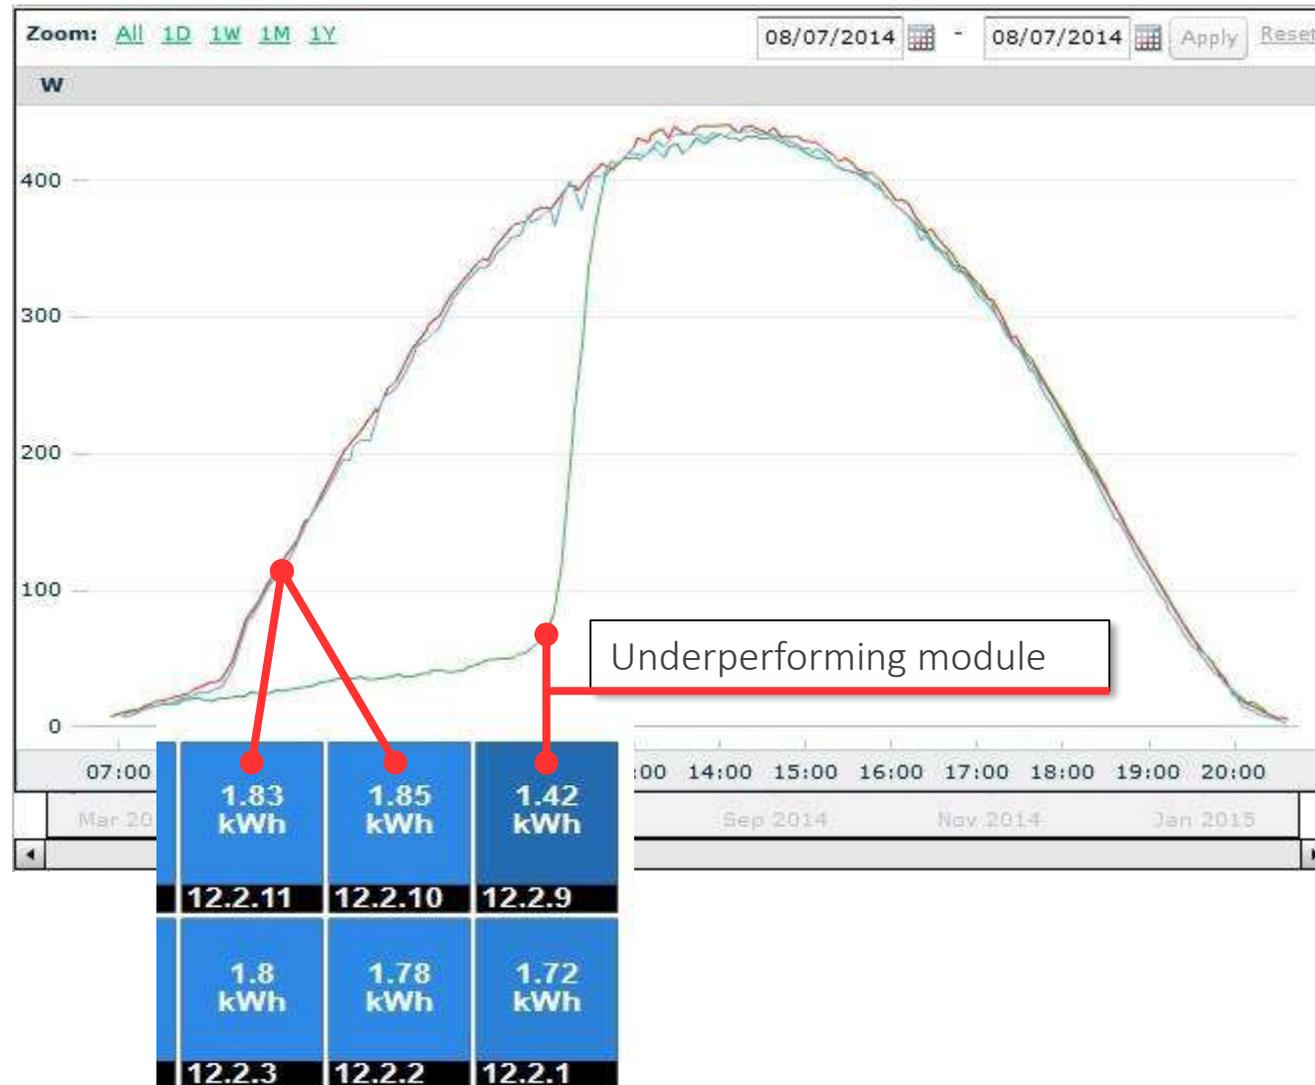

Power Optimizer Examples

Power Optimizer Example 1

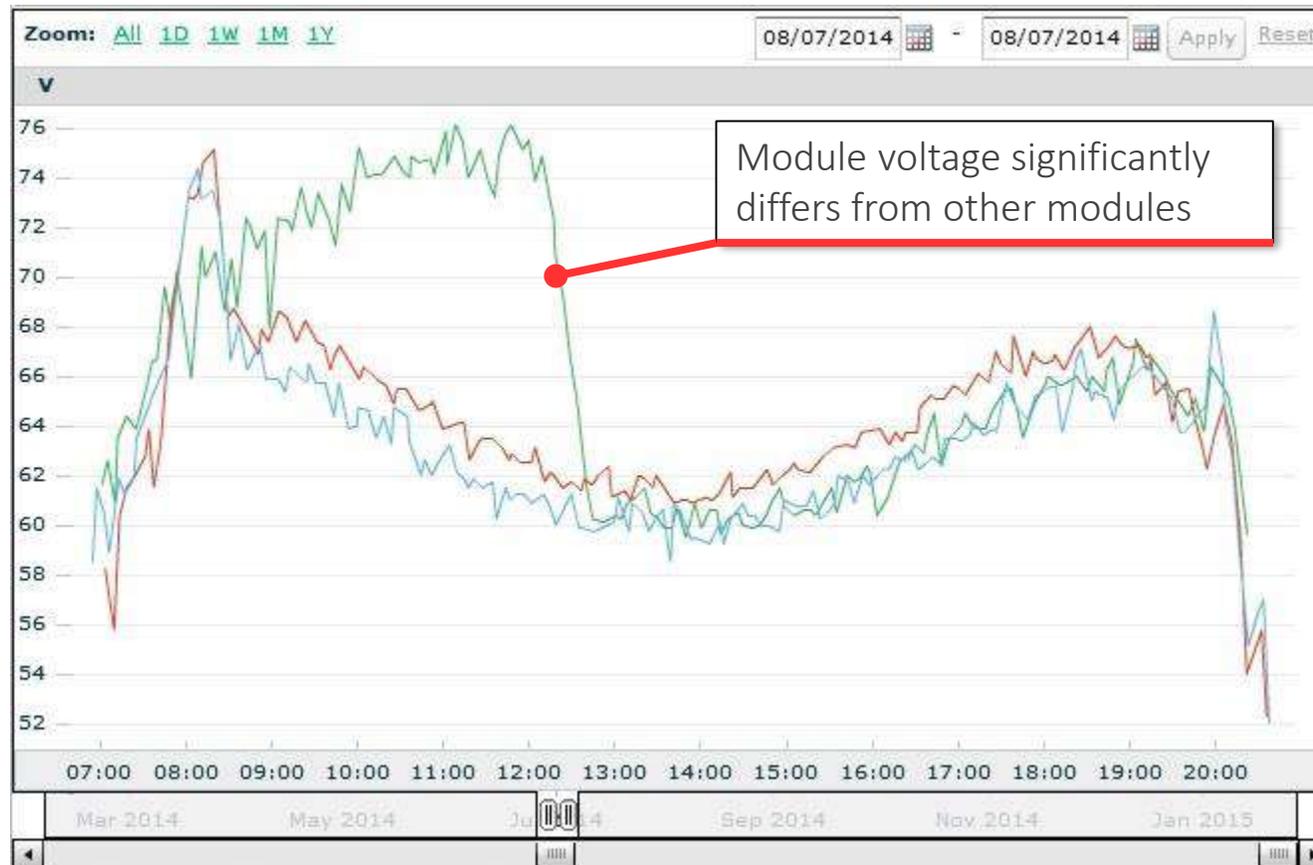

Power Optimizer Example 2

Power Optimizer Example 2

Clear Indication of Shading

Thank You!

Cautionary Note Regarding Market Data & Industry Forecasts

This power point presentation contains market data and industry forecasts from certain third-party sources. This information is based on industry surveys and the preparer's expertise in the industry and there can be no assurance that any such market data is accurate or that any such industry forecasts will be achieved. Although we have not independently verified the accuracy of such market data and industry forecasts, we believe that the market data is reliable and that the industry forecasts are reasonable.
